

# The `luatodonotes` package\*

Fabian Lipp<sup>†</sup>  
fabian.lipp@gmx.de

August 11, 2025

## Abstract

The `luatodonotes` package allows you to insert to-do items in your document. At any point in the document a list of all the inserted to-do items can be listed with the `\listoftodos` command.

It is an extended version of the `todonotes` package and uses more advanced algorithms to place the to-do notes on the page. For these algorithms it depends on Lua $\TeX$ .

---

\*This document corresponds to `luatodonotes` v0.5a, dated 2025/08/11.

<sup>†</sup>This documentation and the whole package is based on version 1.0.2 of the `todonotes` package by Henrik Skov Midtiby.

# 1 Introduction

The `luatodonotes` package makes three commands available to the user: `\todo[]{}`, `\missingfigure{}` and `\listoftodos`. `\todo[]{}` and `\missingfigure{}` makes it possible to insert notes in your document about things that has to be done later (todonotes ...). This package is based on version 1.0.2 of `todonotes`<sup>1</sup> by Henrik Skov Midtiby.

The positions of the notes on the page is determined using algorithms implemented in Lua, so you have to process your documents using Lua $\LaTeX$ . The package can be used as a drop-in replacement for the original `todonotes` package, you only need to modify `\usepackage{todonotes}` to `\usepackage{luatodonotes}`. Note that `todonotes` and `luatodonotes` must not be loaded inside the same document.

Some alternatives for the `luatodonotes` package are:

- [easy-todo](#)  
Depends on `color`, `tocloft` and `ifthen`, small feature set.
- [fixmetodonotes](#)  
Depends on `graphicx`, `color`, `transparent`, `watermark`, `fix-cm`, `ulem` and `tocloft`, small feature set.
- [todo](#)  
Depends on `amssymb`, medium feature set.
- [fixme](#)  
Large package with a lot of features.
- [todonotes](#)

Compared to the classical `todonotes` this package has more advanced algorithms and more configuration options to control the position of the notes on the page. Additionally, we are able to place notes at almost every position on the page, e. g., in floating environments or in footnotes. As a disadvantage `luatodonotes` requires Lua $\LaTeX$  for document processing, so a standard `pdf $\LaTeX$`  won't work. Depending on the chosen layout for the to-do notes the runtime can be much higher than with `todonotes`. Labels placed by `luatodonotes` can conflict with text placed with `\marginpar`.

The main reason for considering other packages is that the `todonotes` package is quite large and relies heavily on `tikz`. This can slow down compilation of large documents significantly. The mentioned alternatives have a different feature set and do not rely on `tikz`, which makes them require less resources.

## 1.1 Using Lua $\LaTeX$

It is quite easy to switch from `pdf $\LaTeX$`  to `lua $\LaTeX$` . You only have to load a few different packages. A small guide can be found in the Lua $\LaTeX$  guide<sup>2</sup>.

<sup>1</sup><http://www.ctan.org/pkg/todonotes>

<sup>2</sup><http://mirror.ctan.org/info/luatex/lualatex-doc/lualatex-doc.pdf>

The LuaTeX processor (the `lualatex` executable) should be included in all modern TeX distributions, so you do not need to install additional software. You simply have to run `lualatex` instead of `pdflatex` (or instead of `latex`, `xelatex`).

## 1.2 Usage of `luatodonotes`

The package is loaded with `\usepackage[options]{luatodonotes}`. Valid options are described in Section 1.3. Note that `todonotes` must *not* be loaded. You have to use `lualatex` to process your document, `pdflatex` will not work. The package depends on positions written to the aux-file, so you have to run `lualatex` twice or even three times to get the labels and leaders for the notes right.

`\todo` My most common usage of the `todonotes` package, is to insert an `todonotes` somewhere in a latex document. An example of this usage is the command

`\todo{Make a cake \ldots}`,

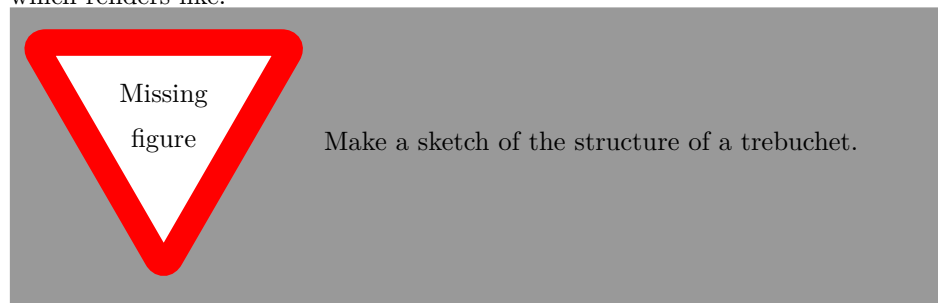

which renders like. The `\todo` command has this structure: `\todo[options]{todo text}`. The `todo text` is the text that will be shown in the todonote and in the list of todos. The optional argument `options`, allows the user to customize the appearance of the inserted todonotes. For a description of all the options see section 1.4.

Make a cake ...

`\todoarea` The `\todoarea` is similiar to `\todo`, but is able to highlight a specified area in the text, to which the note is connected. The command has this structure: `\todoarea[options]{note text}{highlighted text}`. This command was not tested extensively until now, so it should be used with caution.

`\missingfigure` The `\missingfigure` command inserts an image containing an attention sign and the given text. The command takes only one argument `\missingfigure{text}`, a text string that could describe what the figure should consist of. An example of its usage could be

`\missingfigure{Make a sketch of the structure of a trebuchet.}`  
which renders like.

`\listoftodos` The `\listoftodos` command inserts a list of all the todos in the current document. `\listoftodos` takes no arguments. For this document the list of to-do's looks like.

## Todo list

■ Make a cake ... . . . . . 3

Figure: Make a sketch of the structure of a trebuchet. . . . .	3
 And a green note . . . . .	8
 Anything but default colors . . . . .	8
 A note with no line connecting it to the placement in the original text. . . . .	8
 A todonote placed in the text . . . . .	8
 Fill those circles ... . . . . .	9
 A note with a large font size. . . . .	9
 Note with very small font size. . . . .	9
 Short note . . . . .	9
 Short note with prepend . . . . .	9
 Short note with noprepend . . . . .	9
 Testing author option. . . . .	9
 Testing author option. . . . .	9
Figure: Testing a long text string . . . . .	10
Figure: Testing a long text string . . . . .	10
Figure: Add a test image ... . . . . .	10
Figure: Testing . . . . .	11
Figure: Testing figcolor . . . . .	11
 Does this eat the space? . . . . .	13
 Does this eat the space? . . . . .	13

`\todotoc`      The `\todotoc` command adds an entry to the table of contents for list of todos. The command should be placed right before the `\listoftodos` command.

### 1.3 Package options

`disable`      If the option `disable` is passed to the package, the macros usually defined by the package (`\todo`, `\todoarea`, `\listoftodos` and `\missingfigure`) are defined as macros with no effect, and thus all inserted notes are removed.

`obeyDraft`, `obeyFinal`      When the option `obeyDraft` is given, the package checks if the one of the options `draft`, `draftcls` or `draftclsnofoot` is given (this option is usually given to the documentclass). If the `draft` option is given, the functionality of the package is enabled and otherwise the effect of the package is disabled. The option `obeyFinal` does something similar, except that the `todonotes` package is only disabled if the `final` option given.

`danish`, `german`, `ngerman`,  
`english`, `french`, `swedish`  
`spanish`, `catalan`, `italian`  
`portuguese`, `dutch`,  
`croatian`  
`colorinlistoftodos`      Use translations of the text strings "List of todos" and "Missing figure". The default is to use none of these options, which results in english text strings. Currently the following languages are supported: catalan, croatian, danish, dutch, english, french, german, ngerman, italian, portuguese, spanish and swedish.

   Adds a small colored square in front of all items in the Todo list. The color of the square is the same as the fill color of the inserted todonote. This can be useful if there are different types of todos (insert reference, explain in detail, ...) where the color of the inserted todonote marks the type of todo.

`color`  
`backgroundcolor`  
`linecolor`  
`bordercolor`      These options sets the default colors for the `todo` command. There is three colors that can be specified. The border color (default `bordercolor=black`) around

the inserted text, the color behind the inserted text (default `backgroundcolor=orange`) and the color of the line connecting the inserted textbox with the current location in the text (default `linecolor=black!30`). Setting the `color` option to `val` passes this value on to the background and line color options. The specified colors must be valid according to the `xcolor` package.

<code>textsize</code>	<code>textsize=value</code> sets the default text size of the inserted todonotes to the given value. Value is the "name" of the used font size, eg. if the desired fontsize is <code>\tiny</code> use <code>textsize=tiny</code> . The default value is <code>textsize=normalsize</code> .
<code>prependcaption</code>	The <code>prependcaption</code> option triggers a special behaviour of the <code>caption=val</code> option for the <code>todo</code> command, where the given value <code>val</code> is inserted in the inserted todonote.
<code>shadow</code>	If the <code>shadow</code> option is given, the inserted todonotes will be displayed with a gray shadow. I expect that the option will trigger problems with <code>tikz</code> versions prior to 2.0.
<code>figwidth</code> <code>figheight</code>	The <code>figwidth=length</code> option and <code>figheight=length</code> option set the default width and height of the figure inserted by the <code>\missingfigure</code> command. The default value is <code>\linewidth</code> for the width and <code>4cm</code> for the height.
<code>leaderwidth</code>	The <code>leaderwidth=length</code> option specifies the width of the leader lines. The argument is passed to the <code>line width</code> option in <code>TikZ</code> . The default value is <code>1.6pt</code> .
<code>leadertype</code>	The <code>leadertype=type</code> option specifies the shape of the leaders, which are drawn between the labels in the margin and the corresponding sites in text. We use the characterization of the leader types known from boundary labeling: <i>p</i> denotes a segment parallel to the left/right side of the text area, while <i>o</i> denotes a orthogonal segment. <i>s</i> is a straight-line segment. The following types are available ( <code>opo</code> is the default value): <ul style="list-style-type: none"> <li>• <b>s</b>: Straight-line connection between site and label.</li> <li>• <b>sBezier</b>: Uses the straight-line leaders but transforms them into Bézier curves, which are easier to follow for the reader. The generated curves don't cross each other when the straight-line leaders are crossing-free.</li> <li>• <b>opo</b>: This is the style used in the original todonotes package. The leaders start with a horizontal segment at the site in the text, followed by a vertical segment in the margin beneath the text. The last segment is a vertical segment, which connects to the label.</li> <li>• <b>os</b>: This is the style used in common word processing applications like LibreOffice. The leader also starts with a horizontal segment that leads to the margin and is connected to the label by a straight line.</li> <li>• <b>po</b>: The leader starts with a vertical segment at the site in text and is then connected to the label by a horizontal segment.</li> </ul>
<code>positioning</code>	The <code>positioning=algorithm</code> option specifies, which algorithm is used to determine the positions of the notes on the page. You should choose the algorithm depending on the leader type you want to use. You can also use one of the options <code>s</code> , <code>po</code> , <code>bezier</code> , or <code>opo</code> to define the positioning algorithm together with the

leadertype. The default value for this option is `inputOrderStacks`. The following algorithms are available:

- `inputOrder`: Place the labels in the order given by the y-coordinates of the corresponding sites in text. Intended for use with *opo*- or *os*-leaders.
- `inputOrderStacks`: Like the algorithm before, but the labels are clustered before they are placed. Thus the labels are placed nearer to their sites. Intended for use with *opo*- or *os*-leaders.
- `sLeaderNorthEast`: Places labels in a way that they can be connected to their sites by straight-line leaders without crossings. The leaders are attached to the upper right or upper left corner of the label (depending on which site of the text the label is placed). Intended for use with *s*-leaders or Bézier leaders.
- `sLeaderNorthEastBelow`: Like the algorithm before, but the leader is attached to a point that is a constant offset below the corner of the label. Intended for use with *s*-leaders or Bézier leaders.
- `sLeaderNorthEastBelowStacks`: Like the algorithm before, but the labels are cluster before they are placed. Thus the labels are placed nearer to their sites. Intended for use with *s*-leaders or Bézier leaders.
- `sLeaderEast`: Like the algorithms before, but the leader is attached to the center of the right or left boundary of the label. Intended for use with *s*-leaders or Bézier leaders.
- `poLeaders`: Calculates label positions that lead to *po*-leaders with minimum total length. This algorithm depends heavily on the number of notes, so the runtime and memory consumption can get very high.
- `poLeadersAvoidLines`: Like the algorithm before, but tries to avoid overlapping of horizontal leader segments with text. This algorithm depends heavily on advanced LuaTeX features to manipulate the data structures of the page, so it possibly could give conflicts with other packages.

`s` Shorthand options for convenience, which represent common combinations of  
`bezier` leadertypes and positioning algorithms. `leadertype` or `positioning` options fol-  
`opo` lowing one of these options override its settings. They use the following positioning  
`po` algorithms:

- `s`: `sLeaderNorthEastBelowStacks`
- `bezier`: `sLeaderNorthEastBelowStacks`
- `opo`: `inputOrderStacks`
- `po`: `poLeadersAvoidLines`

<code>splitting</code>	<p>The <code>splitting=algorithm</code> option can be used to place the labels on both sides of the text. The notes are only separated when there is enough space on both sides (see <code>minNoteWidth</code>). The default value for this option is <code>none</code>. Available algorithms for this option are:</p> <ul style="list-style-type: none"> <li>• <code>none</code>: Labels are placed in the wider margin only.</li> <li>• <code>middle</code>: The text area is split in the middle in a left and a right half. Labels, whose sites are in the left half of the text, are placed in the left margin, the others in the right margin.</li> <li>• <code>median</code>: The notes are separated at the median of the sites (sorted by x-coordinate). That is, the number of notes in the left and the right margin is equal (except for one note).</li> <li>• <code>weightedMedian</code>: Considers the height of the labels for the median. So the total height of the labels in the left margin is approximately equal to that in the right margin.</li> </ul>
<code>interNoteSpace</code>	The <code>interNoteSpace=length</code> option specifies the minimum vertical distance between two notes. The default value is <code>5pt</code> .
<code>noteInnerSep</code>	The <code>noteInnerSep=length</code> option specifies the <code>inner sep</code> used for the TikZ nodes, i. e., the distance between the border of the note and the text inside it. The default value is <code>5pt</code> .
<code>routingAreaWidth</code>	The <code>routingAreaWidth=length</code> option specifies the width of the so called routing area. This is the area, in which the vertical segment of <i>opo</i> -leaders are placed. The area is also used for <i>os</i> -leaders. The default value is <code>0.4cm</code> .
<code>minNoteWidth</code>	The <code>minNoteWidth=length</code> option specifies the minimum width of the labels. When there is fewer space in one of the margins, this margin is not considered for label placement. If both margins are narrower, no labels are placed and an error message is printed to the console output. The default value of this option is <code>2.0cm</code> .
<code>distanceNotesPageBorder</code>	The <code>distanceNotesPageBorder=length</code> option specifies the horizontal distance from the labels to the borders of the paper. You can adjust this setting to your printer margins. The default value of this option is <code>0.5cm</code> .
<code>distanceNotesText</code>	The <code>distanceNotesPageBorder=length</code> option specifies the horizontal distance between the labels and the text area. With <i>opo</i> - or <i>os</i> -leaders the routing area is inserted additionally so the distance between labels and text area increases. The default value of this option is <code>0.2cm</code> .
<code>rasterHeight</code>	The <code>rasterHeight=length</code> option is used only for the <i>po</i> -leader algorithm. For this algorithm the page is rasterized and the labels are placed only on the positions given by this raster. Decreasing this value can yield better results (i. e., smaller total leader length), but strongly increases the runtime and memory consumption. The default value of this option is <code>1cm</code> .
<code>additionalMargin</code>	The <code>additionalMargin=length</code> option extends the page margins horizontally. To achieve this the page width is increased. The page is extended by the given length on both sides. The layout of the page stays the same but the paper format is changed: the height is left unmodified, but the width is increased by the doubled

value of the given length. This option is useful if you have to adhere to a given layout, whose margins are not wide enough to accommodate the notes. You can safely use this option as the final layout of your document does not change when disabling the `luatodonotes` package. The default width of 2cm for the additional margin is used when the option is given without a length.

**debug** When the `debug` option is activated the package is more verbose on the commandline. Additionally, some markers, which can be used to understand the algorithms, are drawn on the page (depending on the chosen algorithm).

## 1.4 Options for the `todo` command

There are several options that can be given to the `\todo` command. All the options are described here and often I have included examples of the change in visual appearance. Default values for these options can be set using the `presetkeys` command.

```
\presetkeys{todonotes}{fancyline, color=blue!30}{}
```

**disable** The `disable` option can be given directly to the `todo` command. If given the command has no effect.

**color** These options set the color that is used in the current `todo` command. The color classes is the same as used in the `color` package options, see section 1.3. Default values can be set by the color options when the `todonotes` package is loaded.

The `todo` notes inserted in this paragraph is created with the command `\todo[color=green!40]{And a green note}`. The color of the inserted note could be used to mark different types of tasks (insert references, explain something in detail, ...), this could be streamlined by defining new commands like below.

```
\newcommand{\insertref}[1]{\todo[color=green!40]{#1}}
\newcommand{\explainindetail}[1]{\todo[color=red!40]{#1}}
```

And a green note

Anything but default colors

An example that uses all of the color options is given below.

```
\todo[linecolor=green!70!white, backgroundcolor=blue!20!white,
bordercolor=red]{Anything but default colors}.
```

A note with no line connecting it to the placement in the original text.

**line / noline**

If you want to get rid of the line connecting the inserted note with the place in the text where the note occurs in the latex code, the option `noline` can be used.

```
\todo[noline]{A note with no line ...}
```

**inline / noinline**

It is possible to place a `todonote` inside the text instead of placing it in the margin, this could be desirable if the text in the note has a considerable length.

```
\todo[inline]{A todonote placed in the text}
```

A todonote placed in the text

Another usage for the inline option is when you want to add a `todonote` to a figure caption.

Figure 1: A text explaining the image.

Fill those circles ...

```
\begin{wrapfigure}{r}[20mm]{40mm}
\begin{tikzpicture}
\draw[red] (0, 0) circle(0.45);
\draw[green] (1, 0) circle(0.45);
\draw[blue] (2, 0) circle(0.45);
\end{tikzpicture}
\caption{A text explaining the image.}
\todo[inline]{Fill those circles \ldots}
\end{wrapfigure}
```

`size` `size=val` changes the size of the text inside the `todonote`. The commands used to create the notes below are

```
\todo[size=\Large]{A note with a large font size.} and
\todo[inline, size=\tiny]{Note with very small font size.}
```

A note with a large font size.

Note with very small font size.

`list / nolist`

When the option `nolist` is given, the `todo` item will not appear in the list of todos.

A very long and tedious note that cannot be on one line in the list of todos.

The `caption` option enables the user to specify a short description of the `todonote` that are inserted in the list of todos instead of the full `todonote` text.

```
\todo[caption={Short note}]{A very long and tedious note that cannot be on one line in the list of todos.}
```

Short note with prepend:  
A very long and tedious note that cannot be on one line in the list of todos.

The effect of this option is altered with the package option `prependcaption` or the `prepend / noprepend` option for the `todo` command.

The options `prepend` and `noprepend` can be used for setting whether a given caption should be prepended to the `todonote` or not. Globally this can be set using the `prependcaption` option for the package. Below is the effect of the option shown using the code:

```
\todo[prepend, caption={Short note with prepend}]{A very long and tedious note that cannot be on one line in the list of todos.}
\todo[noprepend, caption={Short note with noprepend}]{A very long and tedious note that cannot be on one line in the list of todos.}
```

A very long and tedious note that cannot be on one line in the list of todos.

`author`

The `author` option takes a parameter, the name of the author. The given name is inserted in the `todonote`.

Xavier: Testing author option.

Xavier: Testing author option.

```
\todo[author=Xavier]{Testing author option.}
\todo[author=Xavier, inline]{Testing author option.}
```

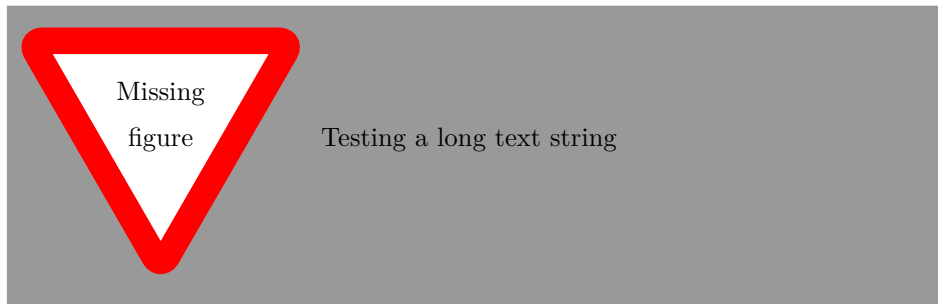

## 1.5 Options for the `missingfigure` command

`figwidth` The `figwidth=length` option sets the width of the figure inserted by the `\missingfigure` command. Length values below  $6\text{cm}$  might trigger some problems with the visual appearance. Try to compare the default of the missing figure command, when the option is given or not.

```
\missingfigure[figwidth=6cm]{Testing a long text string}
```

```
\missingfigure{Testing a long text string}
```

Another usage of the option is when `\missingfigure` is used in the `wrapfigure` environment.

```
\begin{wrapfigure}{r}[2cm]{6cm}  
\missingfigure[figwidth=6cm]{Add a test image \ldots}  
\end{wrapfigure}
```

`figheight` The `figheight=length` option changes the height of the inserted missing figure. The default height is  $4\text{cm}$  and using values lower than this might cause the warning sign to pop out of the gray area.

```
\missingfigure[figheight=6cm]{Testing a long text string}
```

`figcolor`     The `figcolor=color` options sets the background color of inserted missing figures. The default color is `black!40`.

```
\missingfigure[figcolor=white]{Testing figcolor}
```

## 1.6 Options for the `listoftodos` command

The `\listoftodos` command takes one optional argument, that defines the name of the inserted list of todos.

```
\listoftodos[I can be called anything]
```

## 1.7 Troubleshooting

### 1.7.1 Missing Lua files

A potential error message when Lua source files are not found, is the following:

```
! LuaTeX error [\directlua]:1: module 'luatodonotes' not found:
  no field package.preload['luatodonotes']
  [luatexbase.loader] Search failed
```

```

[kpse lua searcher] file not found: 'luatodonotes'
[kpse C searcher] file not found: 'luatodonotes'
[oberdiek.luatex.kpse_module_loader]-eroux Search failed
stack traceback:
  [C]: in function 'require'
  [\directlua]:1: in main chunk.
1.250 \directlua{require("luatodonotes")}

```

This means that the file `luatodonotes.lua` cannot be found by Lua $\TeX$ . It depends on the version of your  $\TeX$  installation in which directories Lua $\TeX$  is looking for Lua source files. You can query these paths with the following command:

```
kpsewhich -show-path=lua
```

See the `kpathsea` documentation<sup>3</sup> for the interpretation of this path. The Lua source files of the `luatodonotes` package should be in one of the searched directories. You can modify the path in your  $\TeX$  configuration or using environment variables. You can query `kpathsea` for a file using the default  $\TeX$  search path with:

```
kpsewhich luatodonotes.lua
```

Be sure to run `texhash` (as root if needed) after moving files into the `texmf` tree.

### 1.7.2 The debug option

You can load the package with the option `debug` (see Section 1.3). It gives some additional information in the console while running Lua $\TeX$  and draws additional information into the output document. For example, the size of the computed areas, in which the labels are placed, is shown in the document. Depending on the chosen layout algorithm some intermediate steps of the algorithms are given.

## 1.8 Known issues

### 1.8.1 Package loading order

The `luatodonotes` package requires the following packages:

- `ifthen` package)
- `xkeyval`                      • `luacode`
- `xcolor`                        • `luatex`
- `tikz`                            • `atbegshi`
- `graphicx` (is loaded via the `tikz`   • `xstring`

<sup>3</sup><http://tug.org/texinfohtml/kpathsea.html>

- zref-abspage
- soul
- ifoddpage
- soulpos

When luatodonotes are loaded in the preamble, the package checks if these packages all are loaded. If that is not the case it loads the missing packages with no options given. If you want to give some specific options to some of these packages, you have to load them *before* the luatodonotes package, otherwise you will get an "Option clash" error when latex works on the document.

If both the menukeys and the xcolor (with the option `table`) package should be loaded, the following order must be used.

```
\usepackage[table]{xcolor}
\usepackage{todonotes}
\usepackage{menukeys}
```

### 1.8.2 Spacing around inserted notes

Inserted todo commands will eat the white space after the command.

```
Testing\todo{Does this eat the space?} testing.
```

```
Testingtesting.
```

This can be prevented by adding curly parenthesis after the todo command, like shown below.

```
Testing\todo{Does this eat the space?}{ } testing.
```

```
Testing testing.
```

Does this eat the space?

Does this eat the space?

### 1.8.3 Conflicts with the amsart documentclass

The `amsart` document class redefines some internal commands that is used by the `todonotes` package, this will cause an malfunctioning `\listoftodos` command. The following code to circumvent the problem was given by Dan Luecking on `comp.text.tex`

```
\makeatletter
\providecommand\@dotsep{5}
\makeatother
\listoftodos\relax
```

NOT TESTED NOT TESTED NOT TESTED

Dominique suggests the following workaround.

```
\makeatletter
\providecommand\@dotsep{5}
\def\listtodoname{List of Todos}
\def\listoftodos{\@starttoc{tdo}\listtodoname}
\makeatother
```

#### 1.8.4 Unknown option "remember picture"

If latex throws the error

```
Package tikz Error: I do not know what to do with the option ``remember picture''.
```

It probably means that your latex installation is outdated, as only newer versions of latex driver for tikz supports the `remember picture` option. For additional info consult "Section 10.2.2 Producing PDF Output" in the tikz manual. <http://mirror.ctan.org/graphics/pgf/base/doc/pgfmanual.pdf>

#### 1.8.5 List of todo heading is not correctly formatted

If using natbib, the todonotes list title gets screwed up unless you do something like this:

```
\makeatletter\let\chapter\@undefined\makeatother
```

Suggestion by Richard Stanton.

#### 1.8.6 Some commands not working inside notes

Some commands will not work like expected, when used inside of a note. They will cause errors when processing the document or have simply no effect. This is caused by the mechanism used to layout the notes: The content is written into a `hbox` when a `\todo` is encountered. The contents of this box are then stored until the note is typeset. By that time the contents are taken out of the `hbox` (by `\unhbox`) and put into a `\parbox` with the width required for the note. I don't have a solution for this problem yet.

## 2 Implementation

`luatodonotes.lua` In this section only the source code of the LaTeX package file (`luatodonotes.sty`) is shown. The Lua code is contained in `luatodonotes.lua` and documented by comments inside this file. These comments are primarily describing technical aspects. Information about the implemented algorithms and some theoretical considerations can be found in the following documents:

- Kindermann, P., Lipp, F., and Wolff, A.: Luatodonotes: Boundary Labeling for Annotations in Texts. In: Duncan, C. and Symvonis, A. (eds.) Proc. 22nd Int. Sympos. Graph Drawing GD'14. ### 2.1 Dependencies and definitions

Make sure that the classical `todonotes` package is not loaded as we redefine its commands. Additionally we pretend that `todonotes` 1.0.2 is already loaded. So later attempts to load package `todonotes` are simply ignored. Loading both packages in the same document would produce errors (like “Command already defined”).

```
1 \@ifpackageloaded{todonotes}{
2   \PackageError{luatodonotes}{%
3     Conflicting packages todonotes and luatodonotes\MessageBreak
4     loaded. Aborting.}%
5   The package luatodonotes was designed as a replacement for todonotes. So it
6   is not possible (and not reasonable) to include both of them in the same
7   document.%
8   If you want to use luatodonotes you should delete the todonotes
9   package from\MessageBreak
10  your preamble.\MessageBreak}
11 }{}
12 \expandafter\def\csname ver@todonotes.sty\endcsname{2014/07/14}
Check if LuaTeX is used.
13 \RequirePackage{ifluatex}
14 \ifluatex\else
15   \PackageError{luatodonotes}{LuaTeX is required for this package. Aborting.}%
16   This package can only be used with the LuaTeX engine\MessageBreak
17   (command `lualatex'). Package loading has been stopped\MessageBreak
18   to prevent additional errors.}
19 \fi
Loads the packages dependencies.
20 \RequirePackage{ifthen}
```

```

21 \RequirePackage{xkeyval}
22 \RequirePackage{xcolor}
23 \RequirePackage{tikz}
24 \usetikzlibrary{positioning}
25 \usetikzlibrary{intersections}
26 \usetikzlibrary{decorations.pathmorphing}
27 \RequirePackage{luacode}
28 \RequirePackage{atbegshi}

31 \RequirePackage{ifoddpages}
32 \RequirePackage{soul}
33 \RequirePackage{soulpos}
34 \RequirePackage{etoolbox}

```

The package `luatex` must not be loaded in new TeX distributions as the definition of `\newattribute` in it conflicts with newer versions of Lua<sup>A</sup>T<sub>E</sub>X. Older versions of `luatexbase` include the package `luatex` by themselves, for newer versions the Lua<sup>A</sup>T<sub>E</sub>Xkernel should include the commands that we need (e.g., `\newattribute`).

```

35 \@ifpackagelater{luatexbase}{2013/05/04}{}{

265   \ifdefined\pdfpagewidth\else\let\pdfpagewidth\pagewidth\fi
266   \pdfpagewidth=\@todonotes@modpaperwidth%
267   \addtolength{\hoffset}{\@todonotes@additionalMargin}%
268 }

```

## 2.3 Initialisation of our Lua code

In this part we define some of the variables used by Lua depending on the package options and do some other initialisation tasks.

We first need some temporary dimensions, which are written by  $\TeX$  and read from Lua. We use dimensions here because it is easier to access  $\TeX$  dimensions from Lua than  $\LaTeX$  lengths. We use `tex.dimen` in Lua to access dimensions. The first dimensions are used when extracting the absolute coordinates of a position on the page.

```
269 \newdimen\@todonotes@extractx
270 \newdimen\@todonotes@extracty
```

The following savebox and dimensions are used to calculate the height of a certain label. The box and dimensions are filled by  $\TeX$  and then read from Lua.

```
271 \newsavebox\@todonotes@heightcalcbox
272 \newdimen\@todonotes@heightcalcboxdepth
273 \newdimen\@todonotes@heightcalcboxheight
```

The following savebox is used to store the contents of a note and is then read from Lua.

```
274 \newsavebox\@todonotes@notetextbox
```

The following dimensions are used to read `\baselineskip`, `\normalbaselineskip` and `\f@size` from Lua. We need `\normalbaselineskip` as `\baselineskip` is set to 0 inside tabular cells. Dimension `\@todonotes@currentsidemargin` is set to the left margin, i. e., to the value of length `\oddsidemargin` or `\evensidemargin` depending on the type page.

```
275 \newdimen\@todonotes@baselineskip
276 \newdimen\@todonotes@normalbaselineskip
277 \newdimen\@todonotes@fontsize
278 \newdimen\@todonotes@currentsidemargin
```

Loading our main Lua file.

```
279 \directlua{require("luatodonotes")}
```

Setting variables to values given by package options.

```
280 \directlua{luatodonotes.noteInnerSep =
281   string.todimen("\luatexluaescapestring{\@todonotes@noteInnerSep})}
282 \directlua{luatodonotes.noteInterSpace =
283   string.todimen("\luatexluaescapestring{\@todonotes@interNoteSpace})}
284 \directlua{luatodonotes.routingAreaWidth =
285   string.todimen("\luatexluaescapestring{\@todonotes@routingAreaWidth})}
286 \directlua{luatodonotes.minNoteWidth =
287   string.todimen("\luatexluaescapestring{\@todonotes@minNoteWidth})}
288 \directlua{luatodonotes.distanceNotesPageBorder =
289   string.todimen("\luatexluaescapestring{\@todonotes@distanceNotesPageBorder})}
290 \directlua{luatodonotes.distanceNotesText =
291   string.todimen("\luatexluaescapestring{\@todonotes@distanceNotesText})}
292 \directlua{luatodonotes.rasterHeight =
293   string.todimen("\luatexluaescapestring{\@todonotes@rasterHeight})}
```

Set the variables for the used algorithms and leader types depending on the corresponding package options.

```
294 \directlua{luatodonotes.setPositioningAlgo("\luatexluaescapestring{\@todonotes@positioning})}
295 \directlua{luatodonotes.setSplittingAlgo("\luatexluaescapestring{\@todonotes@splitting})}
```

```
296 \directlua{luatodonotes.setLeaderType("\luatexluaescapestring{\@todonotes@leadertype})}
```

The following commands are used to detect the absolute positions of lines on the page.

We first need to define a command to be able to insert the position from `\pdflastypos` into a write-whatsit in Lua. We need this workaround because we cannot insert `\pdflastypos` directly into the tokenlist in the Lua callback `callbackOutputLinePositions()`.

```
297 \ifdefined\pdflastypos\else\let\pdflastypos\lastypos\fi
298 \def\@todonotes@pdflastypos{\the\pdflastypos}
```

The following commands are written to the temporary `lpo`-file. When reading this file we call a Lua function for each line in the file and thus can collect the line positions in a Lua table.

```
299 \newcommand{\@todonotes@lineposition}[3]{%
300   \directlua{luatodonotes.linePositionsAddLine(#1,#2,#3)}%
301 }
302 \newcommand{\@todonotes@nextpage}{%
303   \directlua{luatodonotes.linePositionsNextPage()}%
304 }%
```

The following macro is used in `AtBeginShipout` to signal in the `lpo`-file that a new page is started.

```
305 \newcommand{\@todonotes@writeNextpageToLpo}{%
306   \ifdefined\tf@lpo%
307     \immediate\write\tf@lpo{\@backslashchar \@todonotes@nextpage}%
308   \fi
309 }
```

Depending on the debug-option of the package we set the corresponding Lua variable here. Additionally, we prepare to print our notes and leaders in foreground when in debug mode.

```
310 \if@todonotes@debugenabled
311   \directlua{luatodonotes.todonotesDebug = true}
312   \newcommand{\@todonotes@AtBeginShipoutUpperLeft}
313     {\AtBeginShipoutUpperLeftForeground}
314 \else
315   \directlua{luatodonotes.todonotesDebug = false}
316   \newcommand{\@todonotes@AtBeginShipoutUpperLeft}
317     {\AtBeginShipoutUpperLeft}
318 \fi
```

Define commands that are used for every `tikzpicture` to disable externalization. We only call the `\tikzexternaldisable` command if it is defined (i.e., the externalization library for TikZ is loaded). Externalization is reenabled after the end of the group (if it was enabled before).

```
319 \newcommand{\@todonotes@before@tikzpict}{\begingroup%
320   \ifdefined\tikzexternaldisable\tikzexternaldisable\fi}
321 \newcommand{\@todonotes@after@tikzpict}{\endgroup}
```

Initialise the script when all Lua variables are set according to the package options.

```
322 \directlua{luatodonotes.initTodonotes()}
```

646     \checkoddpage%
647     \ifoddpageoroneside%
648     \@todonotes@currentsidemargin=\the\oddsidemargin%
649     \else%

```

```

650             \@todonotes@currentsidemargin=\the\evensidemargin%
651         \fi\relax%

```

We switch to the default catcodes of L<sup>A</sup>T<sub>E</sub>X here. This is important if catcodes are changed in the main text, e. g., by a verbatim environment at the end of the page.

```

652         \BeginCatcodeRegime\CatcodeTableLaTeX

```

Calculates the areas, in which the labels can be placed. This calculation depends on currentsidemargin. So this has to be done inside `\AtBeginShipoutUpperLeft` (otherwise odd/even page detection won't work).

```

653         \directlua{luatodonotes.calcLabelAreaDimensions()}%

```

Calculates the needed height for every note. This has to be outside of the tikzpicture because it uses a savebox to compute the height. This box does not work in the tikzpicture.

```

654         \directlua{luatodonotes.calcHeightsForNotes()}% has to be outside of tikzpicture

```

Some classes modify the page margins using `\voffset` and `\hoffset`. Our `tikzpicture` would be aligned using this modified page origin. So we overrule the offsets using a `raisebox` and a negative `hspace`.

```

655         \raisebox{\voffset}{%
656             \hspace{-\hoffset}%
657             \@todonotes@before@tikzpict%
658             \begin{tikzpicture}[remember picture,overlay]

```

Reads the absolute coordinates of every note on the page and writes them to the Lua objects.

```

659             \directlua{luatodonotes.getInputCoordinatesForNotes()}

```

Runs the positioning algorithm and actually draws the notes and leaders.

```

660             \directlua{luatodonotes.printNotes()}
661         \end{tikzpicture}%
662         \@todonotes@after@tikzpict%
663     }%

```

Delete the drawn notes from the Lua lists and prepare for the next page.

```

664         \directlua{luatodonotes.clearNotes()}%
665     \EndCatcodeRegime
666 }%
667 }
668 \fi % Ending \@todonotes@ifdisabled

```

## Change History

0.1	General: The first version of the package . . . . .	1	Remove package <code>luatex</code> for current versions of Lua <sup>A</sup> T <sub>E</sub> X(as it caused problems) . . . . .	16
0.2	General: Added troubleshooting section to documentation . . . . .	1	<code>additionalMargin</code> : Introduce package option <code>additionalMargin</code> . . . . .	21
	Check if LuaTeX is used at begin of package . . . . .	15	<code>s,bezier,opo,po</code> : Provide shorthand commands for most common leader styles . . . . .	20
	Fix wrong linespacing when changing fontsize . . . . .	1	<code>luatodonotes.lua</code> : Deal with notes without a page number (happens when placed in <code>\caption</code> , e.g.) . . . . .	15
	Included suggestions from CTAN submission into documentation . . . . .	1	Fix problems with doubled notes when code is read multiple times (e.g., by <code>tabularx</code> ) . . . . .	15
	<code>drawMarginNoteWithLine</code> : Reset font settings at begin of a todo note . . . . .	31	Less console output unless debug option is set . . . . .	15
	<code>luatodonotes.lua</code> : Compatibility with <code>csquotes</code> package (notes were displayed multiple times when used in <code>\blockquote</code> command) . . . . .	15	Remove two variables from Lua global namespace . . . . .	15
	Correct height calculation for notes with modified fontsize . . . . .	15	0.4	
	Fix problems with recent versions of <code>lualibs</code> . . . . .	15	General: Incorporated some changes from <code>todonotes</code> (version 1.0.5) . . . . .	1
	Make Lua variables and functions local or put them into <code>luatodonotes</code> array (don't pollute global namespace) . . . . .	15	<code>additionalMargin</code> : Fixed problems of the <code>additionalMargin</code> option with certain documentclasses . . . . .	21
0.3	<code>\listoftodos</code> : <code>\listoftodos</code> didn't work with documentclass <code>llncs</code> . . . . .	28	0.5	
	Fix for <code>\listoftodos</code> causing problems with <code>hyperref</code> . . . . .	28	General: Disable TikZ externalization for our <code>tikzpictures</code> . . . . .	24
	General: Consider defined values for <code>\voffset</code> and <code>\hoffset</code> to place the notes in the right position . . . . .	34	<code>additionalMargin</code> : Adapt to new LuaTeX versions, which provide command <code>\pagewidth</code> instead of <code>\pdfpagewidth</code> (but stay backwards compatible) . . . . .	21
	Ensure that package <code>todonotes</code> is not loaded . . . . .	15	Make <code>additionalMargin</code> compatible with <code>\newgeometry</code> . . . . .	21
	Fix position of marker in table cells ( <code>\baselineskip</code> is empty inside tables) . . . . .	23	<code>luatodonotes.lua</code> : Bugfix: The line position calculation didn't use the current page height, which caused an offset on these positions in documents not using <code>a4paper</code> . . . . .	15
	Incorporated some changes from <code>todonotes</code> (version 1.0.4) . . . . .	1		

Fixed bugs when using <code>poLeadersAvoidLines</code> as positioning algorithm in newer LuaTeX versions because some APIs have changed . . . . .	15
0.5a General: Renamed <code>inspect.lua</code> to <code>luatodonotes-inspect.lua</code> in order to avoid file conflicts with other packages. . . . .	1
